

RECEIVER FOR AND METHOD OF EXTENDING BATTERY LIFE

ABSTRACT

A method for and selective call communications unit (CU)  
5 arranged and constructed for extended battery life includes a first receiver  
having low power consumption, preferably operating on a duty cycle, for  
receiving a call signal to provide an enable signal, in one aspect  
conditioned on a match of a selective call address to an address for the  
CU; and a messaging receiver, activated by the enable signal, for  
10 receiving a message intended for the CU. These methods can result in a  
battery life for the CU approaching a shelf life of the battery.
